# Immunogen Information

**Background**: This gene encodes a secreted ligand of the TGF-beta (transforming growth factor-beta) superfamily of

proteins. Ligands of this family bind various TGF-beta receptors leading to recruitment and activation of SMAD family transcription factors that regulate gene expression. The encoded preproprotein is proteolytically processed to generate each subunit of the disulfide-linked homodimer. This protein regulates heart development and adipogenesis. Mutations in this gene are associated with orofacial cleft and microphthalmia in human patients. The encoded protein may also be involved in the pathology of

multiple cardiovascular diseases and human cancers.
