Immunogen Information

| Background | The protein encoded by this gene binds copper and zinc ions and is one of two isozymes responsible | | | |
|-----------------------|--|--|--|--|
| | for destroying free superoxide radicals in the body. The encoded isozyme is a soluble cytoplasmic | | | |
| | protein, acting as a homodimer to convert naturally-occuring but harmful superoxide radicals to | | | |
| | molecular oxygen and hydrogen peroxide. The other isozyme is a mitochondrial protein. In addition, | | | |
| | this protein contains an antimicrobial peptide that displays antibacterial, antifungal, and anti-MRSA | | | |
| | activity against E. coli, E. faecalis, S. aureus, S. aureus MRSA LPV+, S. agalactiae, and yeast C. krusei. | | | |
| | Mutations in this gene have been implicated as causes of familial amyotrophic lateral sclerosis. Rare | | | |
| | transcript variants have been reported for this gene. | | | |
