## MRPL46 Rabbit Polyclonal Antibody

## CAB15428

Product Information	Protein Background
Size:	Mammalian mitochondrial ribosomal proteins are encoded by nuclear genes and help in
20uL, 50uL, 100uL, 200uL	protein synthesis within the mitochondrion. Mitochondrial ribosomes (mitoribosomes) consis of a small 28S subunit and a large 39S subunit. They have an estimated 75% protein to rRNA
Observed MW:	composition compared to prokaryotic ribosomes, where this ratio is reversed. Anothe difference between mammalian mitoribosomes and prokaryotic ribosomes is that the latte
32kDa	contain a 5S rRNA. Among different species, the proteins comprising the mitoribosome different greatly in sequence, and sometimes in biochemical properties, which prevents easy recognition
Calculated MW:	by sequence homology. This gene encodes a 39S subunit protein.
