### Immunogen Information

**Background:** The protein encoded by this gene is a negatively-charged serum glycoprotein that is synthesized by hepatocytes. The encoded protein consists of two polypeptide chains, which are both cleaved from a proprotein encoded from a single mRNA. It is involved in several processes, including endocytosis, brain development, and the formation of bone tissue. Defects in this gene are a cause of susceptibility to leanness.

**Recommended Dilution:** WB,1:500 - 1:2000

**Synonyms:** AHS; A2HS; HSGA; APMR1; FETUA; Fetuin A/AHSG

**Purification Method:** Affinity purification

**Immunogen:** Recombinant fusion protein containing a sequence corresponding to amino acids 19-300 of human Fetuin A/Fetuin A/AHSG (NP\_001613.2).
