Immunogen Information

Background	Carbonic anhydrases (CAs) are a large family of zinc metalloenzymes that catalyze the reversible
	hydration of carbon dioxide. They participate in a variety of biological processes, including respiration,
	calcification, acid-base balance, bone resorption, and the formation of aqueous humor, cerebrospinal
	fluid, saliva, and gastric acid. They show extensive diversity in tissue distribution and in their subcellular
	localization. CA IX is a transmembrane protein and is one of only two tumor-associated carbonic
	anhydrase isoenzymes known. It is expressed in all clear-cell renal cell carcinoma, but is not detected in
	normal kidney or most other normal tissues. It may be involved in cell proliferation and transformation.
	This gene was mapped to 17q21.2 by fluorescence in situ hybridization, however, radiation hybrid
	mapping localized it to 9p13-p12.
