## **Immunogen Information**

Background:	Histones are basic nuclear proteins that are responsible for the nucleosome structure of the
	chromosomal fiber in eukaryotes. Nucleosomes consist of approximately 146 bp of DNA wrapped
	around a histone octamer composed of pairs of each of the four core histones (H2A, H2B, H3, and H4).
	The chromatin fiber is further compacted through the interaction of a linker histone, H1, with the DNA
	between the nucleosomes to form higher order chromatin structures. This gene is intronless and
	encodes a replication-dependent histone that is a member of the histone H3 family. Transcripts from
	this gene lack polyA tails; instead, they contain a palindromic termination element. This gene is located
	separately from the other H3 genes that are in the histone gene cluster on chromosome 6p22-p21.3.
