Fibronectin Rabbit Polyclonal Antibody

CAB7488

Product Information	Protein Background
Size:	This gene encodes fibronectin, a glycoprotein present in a soluble dimeric form in plasma, and
20uL, 50uL, 100uL, 200uL	in a dimeric or multimeric form at the cell surface and in extracellular matrix. The encoded preproprotein is proteolytically processed to generate the mature protein. Fibronectin is
Observed MW:	involved in cell adhesion and migration processes including embryogenesis, wound healing, blood coagulation, host defense, and metastasis. The gene has three regions subject to
290kDa	alternative splicing, with the potential to produce 20 different transcript variants, at least one of which encodes an isoform that undergoes proteolytic processing. The full-length nature of
Calculated MW:	some variants has not been determined.
