Product Information

Size: Protein Background:

50ul This gene is one of several Cys-Cys (CC) cytokine genes clustered on the q-arm of

chromosome 17. Cytokines are a family of secreted proteins involved in **Reactivity:**

immunoregulatory and inflammatory processes. The CC cytokines are proteins

characterized by two adjacent cysteines. The cytokine encoded by this gene displays

chemotactic activity for monocytes, lymphocytes, basophils and eosinophils, but not

neutrophils. This chemokine plays a role in accumulation of leukocytes during

inflammation. It may also be involved in the recruitment of monocytes into the arterial

wall during artherosclerosis.
