Protein Background:

This gene encodes a fatty acid, amide hydrolase that shares a conserved protein motif with the amidase signature family of enzymes. The encoded enzyme is able to catalyze the hydrolysis of a broad range of bioactive lipids, including those from the three main classes of fatty acid, amides; N-acylethanolamines, fatty acid, primary amides and N-acyl amino acid, . This enzyme has a preference for monounsaturated acyl chains as a substrate.

Fusion protein of human FAAH2.
