Product Information

Size: Protein Background:

50ul E2 conjugating enzyme required for the cytoplasm to vacuole transport (Cvt), autophagy, and mitochondrial homeostasis. Responsible for the E2-like covalent hinding of phosphatid dethanglaming to the C terminal Chy of ATC9 like proteins.

binding of phosphatidylethanolamine to the C-terminal Gly of ATG8-like proteins

(GABARAP, GABARAPL1, GABARAPL2 or MAP1LC3A). The ATG12-ATG5 conjugate plays

Human (GABAKAP, GABAKAPLI, GABAKAPL2 or MAPTIC3A). The ATG12-ATG5 conjug a role of an E3 and promotes the transfer of ATG8-like proteins from ATG3 to

Source: phosphatidylethanolamine (PE). This step is required for the membrane association of

ATG8-like proteins. The formation of the ATG8-phosphatidylethanolamine conjugates is

essential for autophagy and for the cytoplasm to vacuole transport (Cvt). Preferred substrate is MAP1LC3A. Also acts as an autocatalytic E2-like enzyme, catalyzing the

conjugation of ATG12 to itself, ATG12 conjugation to ATG3 playing a role in

mitochondrial homeostasis but not in autophagy. ATG7 (E1-like enzyme) facilitates this

reaction by forming an E1-E2 complex with ATG3. Promotes primary ciliogenesis by

removing OFD1 from centriolar satellites via the autophagic pathway.
