NDRG2 Antibody

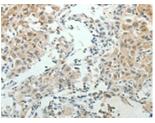

PACO18730

Size:	Protein Background:
50ul	Serine/threonine-protein kinase component of the chromosomal passenger complex
Reactivity:	(CPC), a complex that acts as a key regulator of mitosis. The CPC complex has essential functions at the centromere in ensuring correct chromosome alignment and
Human, Mouse, Rat	segregation and is required for chromatin-induced microtubule stabilization and spindle assembly. Involved in the bipolar attachment of spindle microtubules to
Source:	kinetochores and is a key regulator for the onset of cytokinesis during mitosis. Required
Rabbit	for central/midzone spindle assembly and cleavage furrow formation. Key component of the cytokinesis checkpoint, a process required to delay abscission to prevent both
lsotype:	premature resolution of intercellular chromosome bridges and accumulation of DNA damage: phosphorylates CHMP4C, leading to retain abscission-competent VPS4
lgG	(VPS4A and/or VPS4B) at the midbody ring until abscission checkpoint signaling is
Applications:	terminated at late cytokinesis. AURKB phosphorylates the CPC complex subunits BIRC5/survivin, CDCA8/borealin and INCENP.
