Protein Background:

Apoptotic adaptor molecule that recruits caspase-8 or caspase-10 to the activated Fas (CD95) or TNFR-1 receptors. The resulting aggregate called the death-inducing signaling complex (DISC) performs caspase-8 proteolytic activation. Active caspase-8 initiates the subsequent cascade of caspases mediating apoptosis. By similarity. Involved in interferon-mediated antiviral immune response, playing a role in the positive regulation of interferon signaling. By similarity. Hsu H. , Cell 84:299-308(1996).
