## Protein Background:

Core component of nucleosome. Nucleosomes wrap and compact DNA into chromatin, limiting DNA accessibility to the cellular machineries which require DNA as a template. Histones thereby play a central role in transcription regulation, DNA repair, DNA replication and chromosomal stability. DNA accessibility is regulated via a complex set of post-translational modifications of histones, also called histone code, and nucleosome remodeling.

Western Blot. Detected samples: A549 whole cell lysate, K562 whole cell lysate; Untreated (-) or treated (+) with 30 mM sodium butyrate for 4 h . All lanes: HIST1H2BC antibody at 1:100. Secondary. Goat polyclonal to rabbit $\operatorname{lgG}$ at $1 / 50000$ dilution. Predicted band size: 14 kDa . Observed band size: 14 kDa .

Immunofluorescence staining of Hela cells (treated with 30 mM sodium butyrate for 4h) with PACO60484 at 1:5, counter-stained with DAPI. The cells were fixed in $4 \%$ formaldehyde, permeabilized using $0.2 \%$ Triton X-100 and blocked in $10 \%$ normal Goat Serum. The cells were then incubated with the antibody overnight at $4^{\circ} \mathrm{C}$. The secondary antibody was Alexa Fluor 488-congugated AffiniPure Goat Anti-Rabbit $\operatorname{lgG}(\mathrm{H}+\mathrm{L})$.

Immunocytochemistry analysis of PACO60484 diluted at 1:10 and staining in Hela cells (treated with 30 mM sodium butyrate for 4 h ) performed on a Leica BondTM system. The cells were fixed in $4 \%$ formaldehyde, permeabilized using $0.2 \%$ Triton X-100 and blocked with $10 \%$ normal goat serum 30 min at RT. Then primary antibody ( $1 \%$ BSA) was incubated at $4^{\circ} \mathrm{C}$ overnight. The primary is detected by a biotinylated secondary antibody and visualized using an HRP conjugated SP system.
