

Technical Manual

ChromaDazzle Indole Assay Kit

Catalogue Code: BA0046

Pack Size: 100 assays

Research Use Only

DESCRIPTION

INDOLE is the primary product of tryptophan breakdown by tryptophanase. The indole test is a commonly performed on bacteria to classify them on their ability to break down tryptophan to indole.

The Assay Genie ChromaDazzle Indole assay kit is based on a modified version of Ehrlich's and Kovac's reagents, which reacts with indole to produce a colored compound at 565 nm. The intensity of this colored compound is directly proportional to the indole in the sample.

KEY FEATURES

Fast and sensitive. Use of 100 μL sample. Linear detection range from 3 to 100 μM indole in 96-well plate assay.

Convenient. The procedure involves adding a single working reagent, and reading the absorbance immediately.

APPLICATIONS

Direct Assays: Indole in biological samples (e.g. indole produced by indole positive bacteria).

KIT CONTENTS (100 TESTS IN 96-WELL PLATES)

Reagent: 12 mL

Standard: 100 μL (10 mM Indole)

Storage conditions. The kit is shipped at RT. Store all components at 4°C upon receiving. Shelf life: 6 months after receipt.

Precautions: reagents are for research use only. Briefly centrifuge Standard tube before opening. Equilibrate all components to room temperature prior assay. Normal precautions for laboratory reagents should be exercised while using the reagents. Please refer to Material Safety Data Sheet for detailed information.

PROCEDURES

Procedure using 96-well plate

1. *Standards.* Prepare 1 mL of 100 μM Premix by mixing 10 μL of the 10 mM Standard and 990 μL of the blank medium (e.g. bacterial growth medium). Dilute standards in 1.5-mL centrifuge tubes as described in the Table.

No	Premix + Medium	Indole (μM)
1	200 μL + 0 μL	100
2	100 μL + 100 μL	50
3	50 μL + 150 μL	25
4	0 μL + 200 μL	0

2. Transfer 100 μL standards into separate wells of a clear, flat-bottom 96-well plate. Transfer 100 μL of each sample into separate wells.

3. Add 100 μL Reagent to the *four Standards* and the *Sample Wells*. Tap plate to mix briefly and thoroughly.

4. Read optical density at 565 nm (520-590 nm).

CALCULATION

Subtract the blank value (#4) from the standard values and plot the ΔOD against standard concentrations. Determine the slope and calculate the indole concentration of Sample as follows:

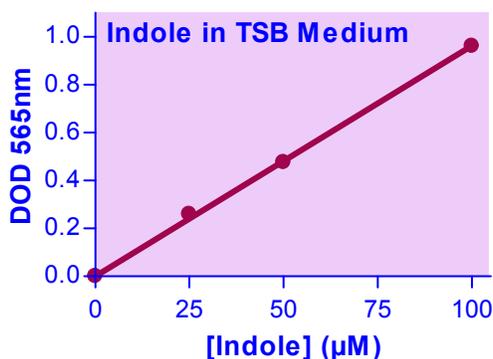

$$[\text{Indole}] = \frac{\text{OD}_{\text{SAMPLE}} - \text{OD}_{\text{BLANK}}}{\text{Slope } (\mu\text{M}^{-1})} \quad (\mu\text{M})$$

$\text{OD}_{\text{SAMPLE}}$ and OD_{BLANK} are optical density readings of the Sample and Media Blank (#4), respectively.

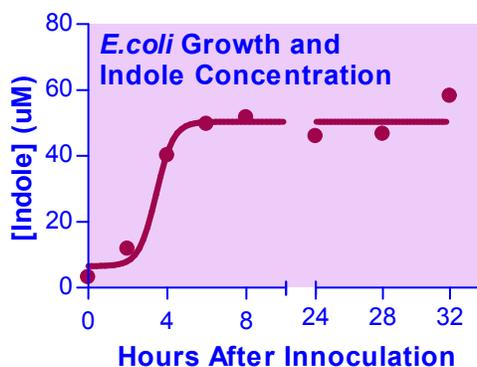

Conversions: 1 μM Indole equals 1.17 mg/dL, or 11.7 ppm.

MATERIALS REQUIRED, BUT NOT PROVIDED

Pipetting devices, centrifuge tubes, clear flat-bottom 96-well plates (e.g. VWR cat# 82050-760), and plate reader.

Indole Standard Curve in TSB Medium

E. coli Growth and Indole Concentration

E. coli cells inoculated into 5 mM Tryptophan medium. Medium samples taken every two hours.
